

Project Description

The **Bright TV Dashboard** project was developed to analyze TV viewership data from the Bright TV dataset using **Google Looker Studio (Data Studio)** and **Microsoft Excel**. The objective of the project is to transform raw television viewing data into meaningful insights that help stakeholders understand viewer behaviour, evaluate channel performance, identify peak viewing times, and analyze audience demographics.

The dashboard presents key performance indicators (KPIs), interactive charts, and filters that allow users to explore viewing trends by month, TV channel, region, age group, and gender. It includes dedicated pages for an overall dashboard overview, channel performance, viewer behaviour, audience segmentation, and insights with recommendations.

In addition to the Looker Studio dashboard, the same visualizations were recreated in Microsoft Excel using Pivot Tables, Pivot Charts, KPI cards, and slicers to provide an alternative reporting platform. The project demonstrates how business intelligence tools can be used to convert data into actionable information, enabling organizations to optimize content scheduling, improve audience engagement, and make informed business decisions based on viewership patterns.
